Data Analysis Internship

Level 1

Task 1: Top Cuisines | Task 2: City Analysis | Task 3: Price Range Distribution | Task 4:
Online Delivery

Dataset: Zomato Restaurant Dataset (9,551 restaurants)

Task 1: Top Cuisines

Objective: Determine the top three most common cuisines and the percentage of restaurants serving each.

Result

Rank	Cuisine	Restaurant Count	% of Total Restaurants
1	North Indian	3960	41.46%
2	Chinese	2735	28.64%
3	Fast Food	1986	20.79%

Insight: North Indian cuisine dominates the dataset, appearing in over 41% of restaurants (note: many restaurants serve multiple cuisines, so percentages do not sum to 100%). Chinese and Fast Food follow as the next most common offerings, reflecting strong demand for these cuisine categories across the surveyed cities.

Task 2: City Analysis

Objective: Identify the city with the most restaurants, average rating per city, and the city with the highest average rating.

Result

City with the highest number of restaurants: New Delhi, with 5,473 restaurants.

City with the highest average rating: Inner City, with an average rating of 4.90 (based on a small number of restaurants).

Top 10 Cities by Average Rating

City	Average Rating
Inner City	4.90
Quezon City	4.80
Makati City	4.65
Pasig City	4.63
Mandaluyong City	4.63
Beechworth	4.60
London	4.54
Taguig City	4.53
Secunderabad	4.50
Lincoln	4.50

Insight: New Delhi overwhelmingly leads in restaurant volume, consistent with the dataset's concentration of Indian listings. However, cities with the highest average ratings tend to have far fewer restaurants, suggesting a small, curated set of highly-rated establishments rather than broad market strength.

Task 3: Price Range Distribution

Objective: Visualize the distribution of price ranges and calculate the percentage of restaurants in each category.

Result

Price Range	Number of Restaurants	Percentage
1 (Low)	4444	46.53%
2	3113	32.59%

3	1408	14.74%
4 (High)	586	6.14%

Insight: Nearly half of all restaurants (46.5%) fall in the lowest price range, and the proportion steadily decreases as price range increases. This reflects a market weighted heavily toward budget-friendly dining options.

Task 4: Online Delivery

Objective: Determine the percentage of restaurants offering online delivery, and compare ratings between those that do and don't.

Result

Percentage of restaurants offering online delivery: 25.66%

Online Delivery	Average Rating
No	2.47
Yes	3.25

Insight: Restaurants offering online delivery have a noticeably higher average rating (3.25) compared to those that don't (2.47). This suggests that restaurants investing in delivery infrastructure may also invest more broadly in overall customer experience, or that delivery availability itself correlates with more established, well-reviewed businesses.
